End of course Assignment.

Design and implement a 3 tier Web application while using the AWS Well Architected Framework Pillars.

- Tier 1 = Database Tier
- Tier 2 = Application on EC2
- Tier 3 = ALB/EC2 Tier

I would like to see an architecture Diagram describing network infrastructure and a separate diagram for your application/database design. (Use lucid charts and download your diagrams when submitting to me)

1. Explain and justify each Pillar as it aligns with your architecture.
2. Specifically justify what you have done to make sure security is accounted for.
3. Explain connectivity between each layer.
